In other words, these files contain instructions on how the sound should be produced when loaded into a specialized third-party app or attached to a playback device. Therefore, you should not expect the program to play the soundtracks or samples, but rather solely display them. Edit the line, color, scale and other display parameters It is worth mentioning that the program comes with a settings panel where you can customize the colors for the notes and effects in your samples. At the same time, you can lock colors, flashes and blur for the notes and specify the speed, count, expansion and size of the particles representing them. The background can also be personalized with horizontal and vertical lines, digits and keyboard.
